1 MS. VALETKEVITCH: I'd like to welcome you all on
2 behalf of the United States Environmental Protection
3 Agency. We are here to discuss the Albion-Sheridan
4 Township Landfill Superfund site, which is in Albion. My
5 name is Heidi Valetkevitch, and I work for the USEPA as a
6 community relations coordinator. I'd like to make some
7 introductions; Leah Evison, who is the remedial project
8 manager at EPA, Jim Myers from the Michigan Department of
9 Natural Resources, John Filpus, from the Michigan
10 Department of Public Health and Liz Bartz, from Earth Tech,
11 a contractor for USEPA. Yes?

12 AUDIENCE: All these names go by me so quickly. Could
13 you provide a print-out sheet so that we know who the
14 speakers are going to be?

15 MS. VALETKEVITCH: Well, actually, on the back of the
16 fact sheet, there's a list of names -- actually, on the
17 blue sheet. It's provided by the Michigan Department of
18 Public Health, and there's some names, as well as the gray
19 fact sheet, on the back sheet. And we all have name tags
20 on.

21 AUDIENCE: Can we go over the names again one more
22 time so I can record these?

23 MS. VALETKEVITCH: Sure. I'm Heidi Valetkevitch from
24 EPA. That's on the gray sheet, or you could look on the
25 agenda, too. Leah Evison from EPA, Jim Myers from the

1 Michigan Department of Natural Resources, John Filpus from
2 the Michigan Department of Public Health. He's on the
3 agenda and the blue sheet. And Liz Bartz works for a
4 contractor called Earth Tech that's working for USEPA.

5 The topic for tonight's discussion is the proposed
6 plan for cleaning up the four areas of concern at the
7 landfill, which are the hazardous and liquid waste drums
8 within the landfill, the current landfill cover, landfill
9 gases and groundwater contamination. USEPA will also
10 present its recommended clean-up plan for addressing this
11 site.

12 Leah will discuss the background of the site, the past
13 studies that were conducted at the site in the last couple
14 years and the proposed clean-up alternatives. John Filpus
15 will discuss the State Public Health role at the site. A
16 question and answer period will then begin. I'd ask you to
17 hold all your public comments until we get through the
18 question-and-answer period so everyone can understand what
19 we're discussing here and they can get all their
20 questions -- although if you do have to leave early and you
21 need to make a public comment, please go ahead and do that.
22 Once all the questions are answered, then we will begin the
23 public comment period. Comments provided to the EPA are
24 very important. We will not make any decisions until all
25 comments are considered.

1 As you can see, we have two court reporters taking
2 down the minutes of the meeting. USEPA will respond to
3 each comment in a document called a Responsiveness Summary,
4 which will be added to the information repository that's
5 already established here at the library. A public comment
6 period for this site began October 3rd and lasts for 30
7 days unless an extension is granted. Extensions grant the
8 public an additional 30 days. All you have to do is ask
9 for an extension, and we'll take that into consideration
10 and most likely grant it. Comments are accepted in written
11 or in oral form. There are public comment forms in the
12 back, actually in the gray fact sheet. There's a sheet
13 that you can hand that to me tonight, you can make an oral
14 comment, or you can send it to me in the mail by November
15 2nd. All comments must be postmarked by November 2nd of
16 this year. When making an oral comment, please remember to
17 state your name. If it's a difficult name, like
18 Valetkevitch, my name, I'd ask you to spell it out so that
19 the court reporter can accurately take it down who said
20 what and all your public comments.

21 For those of you who are not familiar with the
22 Superfund process, let me briefly go over what it is. This
23 is similar to the poster in the back. A preliminary
24 investigation of the site is conducted by EPA in the state.
25 If the site poses an actual or potential threat, the site

1 is placed on something called a National Priorities List,
2 which is a roster of the nation's worst hazardous waste
3 sites. Then a two-part study is conducted. The first part
4 is a pollution study called a remedial investigation, and
5 that identifies the contamination and the site-related
6 threats to public health and the environment. A
7 feasibility study is then conducted and evaluates various
8 approaches to addressing site conditions. USEPA then
9 presents its recommended clean-up plan, and we have a
10 public comment period.

11 That's where we are tonight. After that, after
12 considering all public comments, we sign something
13 called -- it's a legal document, really, called a Record of
14 Decision. The Responsiveness Summary will be attached to
15 the Record of Decision, which the Responsiveness Summary
16 again is a response to all your comments that you will give
17 tonight.

18 Then, after we select the clean-up plan, sign the
19 legal document, we have a remedial design, which is
20 basically working out the engineering plan for the site,
21 and then we have remedial action, which is actual
22 construction and cleaning up the site. And that's it. I
23 just would like you all to sign in on the sign-in sheet.
24 That's how we make you aware of these public meetings and
25 keep you up to date of future actions at the site. And

1 thank you.

2 MS. EVISON: As Heidi mentioned, I'm Leah Evison, the
3 project manager for this Albion-Sheridan Township Landfill
4 Superfund site. Can I have the first overhead. Before
5 answering your questions tonight, what I'm going to do is
6 briefly summarize the history of the site, what we found in
7 the remedial investigation, starting with the landfill
8 itself and then moving out to the surrounding environment
9 and then briefly summarize the clean-up options that we
10 developed and recommend the options that we think are best.
11 As most of you know, the Albion-Sheridan Township Landfill
12 is about a mile east of the city here, between Michigan
13 Avenue and Erie Road. It's about 500 feet north of the
14 north branch of the Kalamazoo River. The landfill there in
15 red covers 18 acres --

16 MR. BUINOWSKI: Can I make a comment please? Why is
17 it they've got that showing on that map in Jackson County?
18 It don't belong in Jackson County. The map is incorrect,
19 so already we're off to a bad start.

20 MS. EVISON: There may be some inaccuracies in the map
21 drawings --

22 MR. BUINOWSKI: We're not doing our homework somewhere
23 along the line. It isn't right. If they can't draw up a
24 map and show where the doggone thing is correctly, what are
25 we listening to here, some rigmarole that -- I feel

1 disappointed that they haven't corrected that. They've had
2 this out for weeks. Do you mean to tell me nobody ever
3 called it to your attention?

4 MS. EVISON: We'll take your comment into
5 consideration and make --

6 MR. BUINOWSKI: Well, all right. Go ahead.

7 MS. EVISON: The landfill is surrounded by residential
8 and commercial property. To the east is the Amberton
9 Village Subdivision, over in this area; to the west, the
10 Orchard Knoll Subdivision, and there are residences in
11 other areas around the site to the south and especially
12 here to the southwest.

13 The landfill began operation in 1966. And the next
14 overhead shows some of the wastes that were accepted by the
15 landfill. It accepted municipal refuse and a variety of
16 industrial waste from the surrounding area, and some of
17 these include scrap metal and wood, metal plating sludges,
18 paint wastes, casting sand and used oil and grease, among
19 others. The landfill was closed by the State in 1981 and
20 was listed as a Superfund site in 1989 due to concern about
21 the industrial waste in the landfill.

22 In 1990, about 40 drums were removed from the surface,
23 and some of those contained hazardous wastes. In 1992, EPA
24 and the State began the remedial investigation. So now I'm
25 going to summarize what we found, starting with the

1 landfill itself. This is a cross-section of the landfill
2 with the hilliness of the land surface exaggerated. This
3 is the landfill mass here, shown here in red. This is the
4 Kalamazoo River here. In blue, underneath the landfill are
5 about 20 to 40 feet of loose sands and gravels and silts,
6 and underlying that is the Marshall Sandstone. It's solid
7 rock but highly fractured.

8 We found that the landfill is up to 35 feet thick, and
9 there's a layer of sand covering most of the waste. In the
10 landfill, sampling the solid wastes, we found low levels of
11 a number of contaminants, including volatile organics and
12 semi-volatile organics, pesticides, PCB's and arsenic. And
13 in the liquid at the base of one of the holes drilled
14 through the landfill, we found low levels of benzene,
15 nickel and vinyl chloride. Now, I'm calling those levels
16 low, but they are above federal drinking water standards.
17 During this past summer, the Michigan Department of Natural
18 Resources dug a number of shallow holes in the surface of
19 the landfill looking for drummed waste, and they found one
20 area that contains about 200 drums of waste, some of which
21 is hazardous.

22 So now I'm going to move out from the landfill out to
23 the surrounding environment, starting with the groundwater.
24 This is a map of the landfill and the monitoring wells that
25 we sampled. The outlined area, outlined in red, is the

1 landfill itself. And the dark green spots show a series of
2 31 monitoring wells that are spread around the landfill.
3 Some of them are right next to each other at different
4 depths, up to 100 feet. These wells helped us to determine
5 that ground water flows mostly to the southeast, in this
6 direction of this arrow, underneath the landfill.

7 We also sampled residential wells surrounding the
8 landfill and looked at the results from the Amberton
9 Village water supply well and some of the monitoring wells
10 over here in the Orchard Knoll area. We found that none of
11 the residential wells are being affected by the landfill at
12 this time. However, there is a plume, or an area of
13 groundwater which is affected from the landfill that
14 extends out to the southwest. In this area here, we
15 detected a number of organic and inorganic contaminants at
16 low levels, in the parts-per-billion range. There was one
17 contaminant, only one, that did not meet federal drinking
18 water standards, and that contaminant was arsenic.

19 These lines show the concentration of arsenic to the
20 southwest of the landfill in micrograms per liter, which is
21 more or less parts per billion. In the highest samples,
22 here shown in dark blue, the level of arsenic exceeds the
23 federal drinking water standard, and at the very center
24 here, it exceeds it by about two and a half times. If this
25 ground water here in that dark blue area were used for

1 drinking water over a long period of time, it would present
2 an increased risk of cancer of about 2 cases in 1,000
3 people, and it could also have toxic effects. Some of that
4 arsenic is probably coming from that landfill, but we think
5 that another source is the bedrock itself under that area.
6 The Marshall Sandstone contains arsenic minerals, and
7 ground water pumped out of it in many different areas
8 contains low levels of arsenic naturally. We think what's
9 happened here is that as the ground water percolates
10 through the landfill, it changes the chemistry of the water
11 in a way that allows the arsenic to be loosened from the
12 rock and go into solution into the ground water. However,
13 as the groundwater flows deeper or further away from the
14 landfill, it becomes more oxidized, and the arsenic goes
15 out of solution and is no long present in the groundwater.

16 So continuing the investigation, we also sampled
17 soils, river water and river sediments. And this, real
18 briefly, summarizes the results. We sampled soils in areas
19 where wind or water could carry contaminants from the
20 landfill, and we sampled surface water and sediments from
21 the river and the marsh areas near it. We detected a few
22 contaminants in each of these areas, but the health risks
23 associated with them are very low. We also conducted a
24 preliminary ecological assessment in the area, and we do
25 not think that the landfill is adversely affecting the

1 habitats or the wildlife of the area.

2 Next I'm going to summarize some of the clean-up
3 options we developed for the site and recommend the options
4 that we think are best. The criteria we used to make our
5 recommendations are explained in the proposed plan fact
6 sheet; that's the gray one. So we developed clean-up
7 options for different areas of the site which are listed
8 here. First we considered what would happen if we did
9 nothing more at this site, what we call the no-action
10 option. If we walked away from the site now, water would
11 continue to percolate through the landfill, corroding drums
12 and carrying a variety of hazardous wastes into the
13 groundwater. This is not an acceptable option to EPA or to
14 the State. So the areas that we developed clean-up options
15 for are the drums, the landfill caps, the gas and the
16 groundwater. And I'm going to go through each of these, in
17 turn, first presenting the option that we're recommending
18 and then mentioning the other options we looked at.

19 For the landfill, for the hazardous and liquid waste
20 drums that were located by the MDNR, we recommend that they
21 be removed and treated off-site. We also recommend removal
22 of other drums of hazardous or liquid wastes that are found
23 as we construct the cap. We estimate that a total of about
24 200 drums would need to be removed, and the cost would be
25 about \$600,000. That covers removal, treatment and

1 disposal off-site.

2 This is a diagram of the landfill cap that we're
3 recommending. The waste is down here, and on top of the
4 water would be a layer of sand to help with gas collection.
5 On top of that would be a flexible membrane liner, and this
6 is the most essential part of the cap. It stops the
7 percolation of rainfall through the landfill. On top of
8 that, there would be cover soil to protect the liner and
9 sand and top soil to allow grass to grow and run-off to
10 leave the landfill without eroding it. We estimate the
11 cost of this cap we're recommending at about \$1.9 million.

12 We also evaluated two other caps for the site. These
13 were clay caps using compacted clay instead of a flexible
14 membrane liner. The first we evaluated is one that meets
15 the minimum requirements for household waste landfills.
16 And the second is one that includes some better protection
17 against frost cracking. One of these caps, the first, was
18 slightly cheaper than the one we're recommending and the
19 second slightly more expensive. But we recommend the
20 flexible membrane liner cap because it's effective at
21 stopping infiltration. It isn't as susceptible to frost
22 cracking as the clay caps and because construction of it
23 will involve less truck traffic than the clay caps.

24 For the landfill gas, these are gases that are
25 generated by decomposing waste in the landfill. We

1 recommend a system of pipes that would be constructed as
2 part of the landfill cap to collect the gases, pump them to
3 central points where they would be treated by flaring,
4 which burns off the volatile compounds, and the cost of
5 that gas system would be about \$700,000.

6 We also evaluated passive venting where gases are
7 vented to the atmosphere, and the cost of that would be
8 about \$300,000. Now, if studies during the design show
9 that there are very few gases generated by the landfill and
10 they could be safely vented, then we might approve that
11 type of option.

12 So now, moving out from the landfill itself to the
13 groundwater, for the groundwater, we recommend regular
14 sampling of about 20 monitoring wells, some which exist now
15 and some which would be new, and these are shown in green
16 around the site. These wells would be sampled both for
17 arsenic and for other contaminants. In addition, we
18 recommend that the nearby residential wells and the
19 Amberton Village water supply well be sampled four times a
20 year to make sure they remain safe.

21 MR. LAMPART: How deep are the wells, on an average?

22 MS. EVISON: They range from, say, 10 feet to 100
23 feet, the monitoring wells. The residential wells, some of
24 them are deeper than that. So they're monitoring -- we
25 found that the contaminants, the arsenic plume, was

1 concentrated in the shallow bedrock where it's more
2 fractured, and as the groundwater moves deeper, the arsenic
3 is no longer traveling with the groundwater. It's
4 reattached to the coatings on the rocks because it becomes
5 more oxidized away from the landfill.

6 We think that after the landfill cap is constructed,
7 the arsenic near the landfill will begin to leave the
8 groundwater just as it does now further away from the
9 landfill. We estimate that it will take about 15 years for
10 the groundwater near the landfill -- that's right
11 here -- to clean up to drinking water standards. We
12 recommend that monitoring continue after that time also.

13 The next overhead summarizes this monitoring option
14 and the other groundwater option. The monitoring that I've
15 talked about, over a period of 30 years, would cost just
16 over \$1 million; however, we recommend a second option, a
17 back-up plan. If the natural groundwater clean-up is too
18 slow or, for some reason, doesn't work, we recommend that
19 in five years we evaluate all the monitoring data,
20 determine if the natural clean-up is happening as fast as
21 we predicted or not. If it's not, we recommend the
22 clean-up method called in-situ or in-place treatment. This
23 would use a system of small wells to pump air or some other
24 oxidizing agent into the groundwater to speed up the
25 process. The treatment would continue until groundwater

1 meets the federal drinking water standards. The estimated
2 cost of that would be about \$1.9 million, which includes
3 the cost of monitoring, since that would have to continue
4 also. We also considered two other options for cleaning up
5 the arsenic, in-place treatment to a more stringent
6 clean-up level, which would cost about \$2.9 million, and we
7 considered pumping the water, treating it above ground and
8 discharging it, perhaps to the Kalamazoo River, for a cost
9 of about \$2.7 million.

10 So, to summarize the recommended remedy for the
11 Albion-Sheridan Township Landfill, we recommend removal and
12 treatment of the drums that contain hazardous or liquid
13 waste, we recommend we construct a flexible membrane liner
14 cap, we recommend active collection and flaring of the
15 landfill gas and that we monitor the natural clean-up of
16 the groundwater for five years. After that, if it's not
17 working, we require in-place treatment until the drinking
18 water standard is met. John?

19 MR. FILPUS: My name is John Filpus. I'm with the
20 Michigan Department of Public Health, Division of Health
21 Risk Assessment. Our division works with the federal
22 Agency for Toxic Substances and Disease Registry, ATSDR.
23 We are charged with preparing documents for public health
24 assessments for Superfund sites nationwide. Our division,
25 under the contract, does use federal assessments for all

1 sites within the state. We've been involved with the
2 Albion-Sheridan Township Landfill since 1990, and we
3 prepared what we called a Preliminary Health Assessment. A
4 copy is available for review in the EPA repository here in
5 the library, and I have a few with me if you wish to take
6 one home. We are in the process of updating the
7 preliminary assessment based on the information gathered
8 during the RI, the remedial investigation. And that
9 document, which we called a public health assessment, will
10 be ready for the public review and comment in a couple of
11 months.

12 We also had at the back table little fact sheets that
13 summarize our department's current understanding of health
14 risks associated with the landfill site. The health
15 assessment will go into much more detail than either of
16 these documents did, and we will put it out for public
17 comment as on the document before we finalize it.

18 One thing to clarify is that public health assessments
19 are different documents from the risk assessments put out
20 by the EPA for their remedial investigation program
21 process. Public health assessments also address health
22 concerns of the community on the site and the hazards from
23 the contamination in the environment. Basically, any
24 comments, information regarding the site are welcome at any
25 time, even outside the formal comment period. That's what

1 I'm here tonight -- if anybody has health-related questions
2 during the meeting, I will attempt to answer or pass it on
3 to people with the appropriate knowledge back in the
4 Department, and we will get back to you. Addresses and
5 telephone numbers are listed on the blue fact sheet. Yes?

6 MR. LOPEZ: My name is Bob Lopez. I'm a resident of
7 Sheridan Township. You represent the Department of Health
8 for the State of Michigan?

9 MR. FILPUS: Yes.

10 MR. LOPEZ: Do you keep -- your health department
11 keeps statistics of the types of cancers that are in this
12 area and illnesses or whatever? And the reason why I ask
13 that is that we have so many contaminant sites in the
14 greater Albion area, probably within a mile radius of all
15 this. In addition, we have -- how many Superfund sites do
16 we have?

17 AUDIENCE: Six.

18 MR. LOPEZ: Six Superfund sites. This is just one of
19 them. And what I'm really concerned with is what kind of
20 cancers are coming from this particular area? People who
21 live here -- you know, through the industry pollutants and
22 so forth and past sins -- do you carry those statistics
23 here? I think that's vital for our area.

24 MR. FILPUS: Yes, we do have cancer statistics. The
25 Office of the State Registrar does amass -- does keep

1 cancer statistics. In fact, our public health assessment
2 which is coming out includes an analysis of the statistics
3 for -- unfortunately, the smallest area we could get was a
4 zip code area, covering Albion all the way out to Amberton
5 Township and the surrounding area. And our numbers come
6 up, on that large a basis, no worse than anywhere else in
7 the country, not discernably different; if anything, fewer
8 cancers than you would expect, based on nationwide
9 statistics.

10 MR. LOPEZ: So your raw data shows that?

11 MR. FILPUS: Yes.

12 MR. LOPEZ: Okay. Where can we get this raw data so
13 that we can look at it, the public? I know it's in
14 process, you said.

15 MR. FILPUS: Yes. That document is in process. I'd
16 have to talk -- give me your name and address, and I will
17 send you what I can on that basis.

18 MR. LOPEZ: How many here would be interested in this
19 raw data?

20 (Showing of hands)

21 MR. LOPEZ: So make sure you sign a slip for him so we
22 can have that at our disposal. Thank you.

23 MS. VALETKEVITCH: We'll start the question-and-answer
24 period. We've already sort of started it. I'd like to
25 open it up for any questions and answers.

1 MS. PENNOCK: What are the risks of those barrels
2 breaking or leaking when they're trying to remove them, and
3 how do they go about removing them so that doesn't happen,
4 especially if they're all buried close together? Two
5 hundred to 400 barrels is quite a few.

6 MR. MYERS: During any sort of barrel removal that
7 we'd perform, special care would be taken to avoid that,
8 but we would provide measures -- what we call a staging
9 area -- you know, once we remove the barrel, to sit that on
10 the ground, and once a buried barrel is removed, it's
11 placed in another drum, which we call an over-pack drum.
12 That barrel, obviously, is brand new and considered much
13 more stable than any sort of barrel that's in place which
14 may be corroded to a certain extent. During any removal
15 action, there is always the risk that one of your barrels
16 might be compromised and some liquid or solid waste might
17 leak out. In that event, the soils surrounding that or
18 underneath that would also be excavated, and that soil
19 would be put into an over-pack drum, and that would be
20 disposed of also as a hazardous waste.

21 MR. LOPEZ: Bob Lopez. I'm concerned about migration.
22 It's been a little while since you did your studies with
23 the well drilling and so forth there. What causes
24 migration of contaminants to happen that could accelerate
25 it over a period of time? Is there anything that might be

1 there that we don't know about?

2 MS. EVISON: I presume you're mostly talking about
3 groundwater migration, since that's where the contaminants
4 are here.

5 MR. LOPEZ: Yes.

6 MS. EVISON: The rate of groundwater flow does change
7 seasonally a little bit. The measurements we've taken have
8 been in different seasons over the last several years, so
9 we have some handle on what the range of movement is.
10 Actually, if you recall, the contaminants are located
11 within, let's say, 600 feet of the landfill. That's where
12 most of the detectable arsenic is. The groundwater itself
13 in the shallow bedrock is moving about 40 feet per year
14 through that area. So the groundwater continues to move
15 through that area but does not carry the arsenic further
16 downstream. And the answer (sic) is, why not? We've
17 sampled further down-gradient or downstream, and it's not
18 there anymore. That's what leads us to believe that even
19 though the groundwater is moving through there, the
20 chemical environment is changing as the groundwater moves
21 further away from the landfill and the arsenic goes out of
22 solution. Does that --

23 MR. LOPEZ: Yeah. I have other questions, but let
24 other people -- it gives me some idea.

25 MS. BARTZ: I think -- I may be wrong, but during the

1 remedial design, I think we would call for a round of water
2 samples.

3 MS. EVISON: Definitely, yes, to give it time to kind
4 of --

5 MR. LOPEZ: Right; I know you mentioned that. But I
6 was thinking about the rate so far, and will it go further
7 than where you have the wells already done right now, you
8 know?

9 MS. EVISON: Just before the design were implemented,
10 there would be a full round of sampling to make sure that
11 we're putting those final monitoring wells in the right
12 place and we're not losing anything.

13 MR. FILPUS: The monitoring wells are spaced far
14 enough out from the site that they do not -- the outermost
15 ones do not get contamination.

16 MR. LOPEZ: In other words, have you done a well away
17 from it where there is no apparent contamination so that
18 you can go back to see if there's migration up to that
19 point? This is what I'm wondering or concerned about.

20 MS. EVISON: Yes.

21 MR. LOPEZ: Okay. That's part of your drilling and so
22 forth of test wells?

23 MS. EVISON: Yes.

24 MR. TAYLOR: Lawrence Taylor. I'm a geologist, a
25 professor at Albion College. And I've had a chance to

1 review the report that Earth Tech has made of the landfill,
2 and I have some questions which I think might be of
3 interest to the community. Some of these questions I have
4 had answered to me personally, but it might be of interest
5 to everybody here.

6 MS. VALETKEVITCH: Go ahead.

7 MR. TAYLOR: One of the questions deals with the
8 analyses that were made of the landfill itself. There were
9 three sampling wells placed in the landfill, and they all
10 detected quite low levels of contaminants in the sampling
11 sites. And the question is, considering the history here
12 of industrial waste disposal, which is nicely summarized
13 here in the background information, which includes metal
14 plating sludges, other materials such as paint wastes and
15 thinners, oil and grease and dust and dirt containing fly
16 ash and so on, considering the history here of the kinds of
17 contaminants that were dumped in this landfill, it seems
18 that these sampling sites certainly haven't picked up any
19 high levels of these contaminants, based upon the analyses
20 that were made. So one of my questions is, why are these
21 sites at such a low level? I'm glad to see that, I mean.
22 It's encouraging to note that they haven't picked up these
23 real high concentrations.

24 Then let me go through a couple of questions which are
25 related to that, and then maybe you can answer them. The

1 second question deals with the sampling of the ground water
2 directly beneath the landfill. That's the area where you
3 would expect the groundwater to become the most
4 contaminated, and there's no sampling of that groundwater
5 system directly below the landfill. And it would be
6 interesting to know what that water quality is, because
7 that's probably going to be the source of the plume that's
8 going to be moving to the southwest from the landfill site.
9 Eventually, that material, perhaps maybe not for ten years
10 or so, may be getting into that area and, of course, that's
11 why you're doing your monitoring.

12 Another aspect of this is what effect is pumping the
13 wells in the vicinity at high rates going to have in
14 attracting the plumes? What is the zone of capture, for
15 instance, for the wells that are pumping there and
16 servicing Amberton Village in the northeastern corner on
17 the landfill, and what are some possibilities, if you did
18 have other wells in the vicinity that were pumping at very
19 much higher rates, that that would reverse the direction of
20 flow of the plumes, and would those high pumping rates
21 perhaps attract the contaminants in that direction? So
22 maybe you could refer to some of them -- as I say, there's
23 a number of questions, but they're related, so I
24 thought --

25 MS. EVISON: Good questions. Let me start with the

1 first one. We were surprised when we sampled the landfill
2 that the level of contaminants were fairly low. One answer
3 is that our records or reports of the way the wastes were
4 dumped in the landfill are that there were no discreet
5 dumping areas for certain wastes, that as industrial wastes
6 came in, they were disposed alongside of the household
7 wastes in particular trenches, and then when that trench
8 was full, they moved on to the next. And so it may be that
9 the gross contaminants were disbursed enough that those
10 high levels are just not very concentrated. Other than
11 that, you know, some contaminants will degrade through
12 time, and there has been, you know, some time since the
13 landfill began. And some of the sources of industrial
14 wastes, although they may have had some hazardous
15 constituents, perhaps they weren't as concentrated as we
16 had feared. Do you have anything else to add?

17 MS. BARTZ: No, not really. Again, we were really
18 surprised that the groundwater contamination wasn't as
19 high -- it was very low. We went out there -- instead of
20 doing it in two phases -- a lot of times we'll go in and
21 install monitoring wells in just the upper aquifer, and
22 then, depending on those results, then we would go back and
23 look at the bedrock. But we decided to drill as many wells
24 as we could in one phase. I think if we had done it in a
25 phased approach, we might have missed the bedrock, because

1 there wasn't much contamination in the unconsolidated
2 sediments.

3 MS. EVISON: Let me go on to your second question
4 about why we didn't drill deeper through the landfill.
5 When we drilled to the landfill, we tried to stop right at
6 the base of the waste. And the reason was that, although
7 there is no liner, no artificially constructed liner in the
8 landfill, there may be a layer of silts or clays underling
9 some parts of the landfill that are helping to keep the
10 waste in place, and if that's there, we certainly don't
11 want to puncture it and allow further contamination into
12 the groundwater.

13 However, we did encounter a small amount of
14 groundwater at the very bottom of one of those holes
15 through the waste, and that's the one where I showed that
16 we found vinyl chloride, benzene and nickel slightly above
17 drinking water standards. So even right under the
18 landfill, it's not terribly contaminated. We did drill
19 right off the edge of the landfill deeper, so that's as
20 close as we could get safely. The last question about
21 pumping rates; we didn't see any effect of the Amberton
22 Village pumping wells on the shallow groundwater flow
23 underneath the landfill. Those wells are enough deeper and
24 are pumping at a rate that evidently is not affecting the
25 flow where the contaminants are.

1 MS. BARTZ: They're 350 feet deep. The Amberton
2 Village wells are 330 feet deep.

3 MR. TAYLOR: What's the pumping rate? I'd be
4 interested in --

5 MS. BARTZ: Off the top of my head, I don't know, and
6 I think it's cyclic. It's on an as-needed basis.

7 MS. EVISON: Most of the arsenic is at around a
8 50-foot depth in the shallow, fractured bedrock. If other
9 wells were put in the area, you know, large wells pumping
10 at high rates, it would be very important to look carefully
11 at what effect that could have. If a water supply well
12 were further away than the Amberton Village well and deep
13 like the Amberton Village well, I wouldn't expect it to
14 have any effect, but again, it's an important thing to look
15 at.

16 MS. DERR: The Amberton Village wells are east of this
17 landfill?

18 MS. EVISON: Right.

19 MS. DERR: Your flow is northeast to southwest. What
20 about Orchard Knoll? Those wells are all contaminated?

21 MS. EVISON: Right now, at Orchard Knoll, there are
22 contaminants that were discovered during sampling a few
23 years ago. Now, in sampling that was done more recently,
24 those contaminants have not been detected. But that area
25 in Orchard Knoll is a little bit being affected by pumping

1 at McGraw-Edison, and if you remember --

2 (Overhead displayed to audience)

3 MS. BARTZ: Orchard Knoll doesn't show up very well in
4 this figure. The Orchard Knoll subdivision; it's like
5 right off of here; is that right? Can you see or not?

6 MS. DERR: I don't think it's that close to the
7 highway. It's up behind that church. So it's farther
8 down.

9 MS. BARTZ: Down in this area here? (indicating)

10 MS. DERR: It's down about where your first two dots
11 are.

12 MS. EVISON: One of the things that we looked at
13 carefully, to be sure that we were capturing -- that we
14 knew about all the contamination that might be coming from
15 this landfill. These green spots are the proposed
16 locations for monitoring wells, and you notice that there's
17 some off in this direction that are put here because we
18 want to be sure that we're not missing any groundwater flow
19 that's going up there, and that's especially a concern of
20 the Michigan Department of Natural Resources.

21 MS. VALETKEVITCH: Did that answer your question,
22 ma'am?

23 MS. DERR: (Nodding head in affirmative).

24 MS. EVISON: Did I answer what you wanted?

25 MS. DERR: Yes, that answers it.

1 MR. LOPEZ: Bob Lopez, Sheridan Township. I
2 understand -- if I'm wrong, maybe someone can correct
3 me -- that Orchard Knoll does have city water out there
4 now.

5 MS. DERR: Yes, it does have it.

6 MR. LOPEZ: It does have that because of contaminants
7 in that area. So I just wanted to make sure that's noted,
8 because we have another Superfund site, not far from it.
9 It's the Brooks, which hopefully was going to be approved
10 for clean-up. I haven't heard yet.

11 MS. EVISON: What I was talking about was sampling of
12 monitoring wells that are in place out there, and you may
13 well be right about the residential wells.

14 MR. LOPEZ: I see.

15 MS. VALETKEVITCH: They're abandoned, and they've been
16 hooked up.

17 MR. LANOUE: My name is Mike LaNoue, and I'm with a
18 group called the Anti-Burn Coalition, and we're very
19 concerned about this site and all the other Superfund sites
20 in light of the fact that perhaps another Superfund site is
21 going to be created here in Albion. There's a group that
22 is proposing building an incinerator here in town, and, in
23 essence, creating another toxic waste site. And the
24 question was asked by the geologist, Mr. Taylor, and I'd
25 like you to speak to this if you could, and it's been

1 raised that there are, you know, six Superfund sites,
2 including this one, in the area. Now, this proposed
3 incinerator has indicated that they might drill wells,
4 large wells and pump as much as 600,000 to a million
5 gallons of water per day. And we're all very concerned
6 with the traveling of groundwater and contaminants in the
7 area and the idea that the aquifer has arsenic and radon
8 gas in it already, and we're wondering, can you speak to
9 the other Superfund sites in the area like Airco Industrial
10 Gases -- I'm sure you're familiar with that -- the Brooks
11 Foundry, which has been mentioned, Mid-Michigan Metal
12 Products and some of the other sites that are there with
13 foundry sand and other contaminants. And also, I'd like to
14 find out exactly how the -- I have a whole bunch of
15 questions that I'd like to ask; that's one of them. You're
16 proposing a clean-up of about between 4.3 and \$6 million.
17 Who's going to pay for it? I'd like to know that. I
18 understand that the EPA is suing or has a suit on file in
19 court right now -- is that correct? -- naming the city and
20 Sheridan Township as responsible parties for this. And
21 what's the status of that? I'd like to know about that.
22 And I could ask a whole bunch more questions, but I think
23 I've already taken up enough time.

24 MS. VALETKEVITCH: Sir, you want to know about the
25 other national priority listing sites?

1 MR. LANOUE: Yes. You know, this one, it's taken you
2 five years to get to this one. How long is it going to
3 take to get to the other one?

4 MS. VALETKEVITCH: So three questions. I think maybe
5 we should get a clarification on how many Superfund sites.
6 This is a Superfund site. A Superfund site is a site, a
7 hazardous waste site, that is a priority to the federal
8 government and to the states to get cleaned up. They're
9 all across the country. And is this a Superfund site? I
10 believe that -- help me out here.

11 MS. EVISON: McGraw-Edison is a Superfund site.

12 MS. VALETKEVITCH: What other ones?

13 MS. EVISON: None of the others are listed on the NPL.
14 They may be state clean-up sites.

15 MR. LANOUE: No; they are EPA Superfund sites, Airco
16 Industrial Gases, Brooks Foundry --

17 MS. EVISON: There may be something I'm not personally
18 aware of. Brooks Foundry hasn't been listed on the NPL
19 yet, but how I'd like to answer this is that I'm not the
20 project manager for those sites, and I think your questions
21 really should be answered by the people who know what's
22 happening at those sites. And what I can do is get you the
23 names and phone numbers of those people for each one that
24 is an EPA Superfund site so that you can get questions
25 directly to them.

1 MR. LANOUE: There are six EPA Superfund sites.
2 Whether they're on the NPL at this stage or not, I'm not
3 sure, but they have been identified as Superfund sites.

4 MS. VALETKEVITCH: We will get back to you on those
5 other national priorities.

6 MR. LANOUE: Well, I'd like to know about the
7 groundwater flow and so forth related to that. Can you
8 speak to that? You're experts, and people here are
9 interested. We've got a consultant here from Earth Tech
10 who's also been hired by this organization that's proposing
11 the incinerator, and, you know, it would be interesting to
12 know.

13 MS. EVISON: I guess I'm not clear what the question
14 is.

15 MR. LANOUE: Okay. Professor Taylor asked regarding
16 the migration, what effect large pumping would have on the
17 draw-down of the contaminants, and you could at least speak
18 to this site. And we're talking about, you know, large
19 pumping within about a half a mile of this site.

20 MS. EVISON: If someone proposed a pumping well which
21 would interfere with a clean-up at a Superfund site, it
22 would be a legal issue that we would take on, and, you
23 know, it's something we'd be very concerned about.

24 MR. LANOUE: What would the ramifications of that be?

25 MS. EVISON: I really can't speculate. I know at some

1 sites, you know, there are limitations on people's actions
2 because they're interfering with a clean-up.

3 MR. LANOUE: I see; okay. Good; thank you.

4 MS. BARTZ: Can I just speak a little bit more? We
5 performed a model for the Albion-Sheridan Township Landfill
6 site for modeling a pump and treat at the site. We did not
7 model future scenarios such as if someone put a large well
8 in surrounding the site. That was not part of our
9 investigation because, as we were doing the site, those
10 types of issues weren't coming up. And let me just speak a
11 little bit more. The McGraw Company well, I believe, does
12 have an influence that comes out to about here
13 (indicating), so I'm not sure exactly what the gallonages
14 are, what the depths of their wells are, but they are
15 drawing ground water from here over, but they aren't
16 drawing water from the Albion-Sheridan Township Landfill
17 site.

18 MR. LANOUE: No; they have their own wells; right?

19 MS. BARTZ: Right, but I'm saying their well that
20 they're pumping isn't influencing our groundwater flow.

21 MR. LANOUE: In this scenario?

22 MS. BARTZ: Well, not in scenario, but in actuality,
23 right now.

24 MR. LANOUE: In terms of this Superfund site?

25 MS. BARTZ: Correct, which is what we were

1 investigating.

2 MR. LANOUE: You know, I want to apologize. I
3 appreciate the thorough job that you've done in preparing
4 on this one, but, you know, we're citizens, and we've got
5 to look at the total picture. We can't just look at one
6 Superfund site that you guys took five years to get around
7 to having a public hearing on. Okay? We've got to look at
8 everything. And, you know, the whole picture is important.

9 MS. VALETKEVITCH: You're right.

10 MR. BUINOWSKI: Vic Buinowski. I live on East
11 Michigan Avenue just northwest a little bit of the dump
12 site. Now, just west of me -- to begin with, a gentleman
13 came from Chicago from the EPA about 2 1/2, 3 years ago to
14 the house and asked me a bunch of questions, wanted to know
15 if I could tell him anything that had been dumped in that
16 site and anything else in some of these other areas that
17 he's talking about, some of these other sites that have
18 contamination, like the Brooks Foundry dump, just to the
19 west of me, just about 150, 200 yards on the north side of
20 Michigan Avenue. I'm sure you're aware of that.

21 I told him about another site right next door to the
22 lumber yard. A lot of these people don't realize there's a
23 dump site just to the east of the lumber yard. Brooks
24 Foundry dumped a lot of dirt in there, and that was a deep
25 hole in there at one time. Anyway, he asked me a bunch of

1 questions about that, and I told him what I thought had
2 been dumped, what I'd seen. I've seen septic tanks dumped
3 and stuff into the dump site and, like they say, plating
4 sludge and stuff from Union Steel.

5 Also, in the Brooks Foundry dump site, they dumped a
6 bulk station, the Sinclair Oil bulk station here on the
7 corner of Michigan Avenue and Ionia Street. There was a
8 big tank dumped in there, a gasoline tank that caught fire,
9 and the whole business burned up, the whole bulk station.
10 And the residue from the dirt and the ashes and everything,
11 the drums and everything, was put into the Brooks Foundry
12 dump site. And this gentleman was going to let me
13 know -- I'm still on the mailing list, because I still get
14 this stuff from him, but he never did go any further than
15 that. I just wondered if you can't tell me anything that
16 transpired in the meantime. This has been 2 years ago,
17 2 1/2 years ago that the man was there. I know he was a
18 government man. He had a government license plate on his
19 automobile. He said he was from Chicago.

20 MS. VALETKEVITCH: EPA's regional office is in
21 Chicago, so it must have been someone from EPA. I don't
22 know -- maybe if you could tell me the gentleman's name.

23 MR. BUINOWSKI: I looked today for his -- he gave me a
24 card, but my sweetheart got rid of it.

25 MS. BARTZ: Well, the earlier community relations

1 coordinator, the person that was working on the site before
2 Heidi, his name was Phillip Schutte.

3 MR. BUINOWSKI: No, that don't sound right.

4 MS. BARTZ: Okay. Because he did some interviews
5 2 1/2 years ago when we started on this.

6 MR. BUINOWSKI: This fellow had a "berg" or "stein" on
7 the end of his name. Now, I could be wrong. He left me
8 with the impression he might have been of Jewish ancestry
9 or heritage.

10 MS. VALETKEVITCH: I don't know. I know that EPA
11 employees go out, and they talk to residents --

12 MR. BUINOWSKI: Like this gentleman said, we have more
13 than one or two sites here. We have six sites, that I
14 know. Like he says, it's been five years for this one.
15 What are we going to do with the rest of them? See, they
16 were supposed to monitor this landfill, the state, whoever.
17 And my complaint is -- I'm sorry; I want to apologize for
18 that outburst to begin with, on that map.

19 MS. VALETKEVITCH: That's fine.

20 MR. BUINOWSKI: I just felt somebody wasn't doing
21 their homework. Somebody's getting paid good money, and
22 they come up with stuff like this. Well, I hate to
23 criticize. I make mistakes myself. I'm not perfect. So I
24 apologize for that, but -- I missed the point I was trying
25 to make. Then they're coming in here with this

1 incinerator. Are they going to monitor a little bit better
2 than they did this, or is it going to go on for three,
3 four, five years and we end up with a mess again, with a
4 disaster or something. I mean, I'm not against the
5 incinerator personally, if they take care of it the way
6 they're supposed to, but are they going to? This gentleman
7 said they're going to bore some hole in there to drill
8 600,000 gallons of water to a million gallons of water a
9 day, is it going to draw that stuff out of this landfill?
10 Is it going to draw the stuff out of the Brooks Foundry
11 dumps, the two dumps that I know of?

12 And you want to remember, in back of Brooks Foundry,
13 at the same time, they dumped thousands of yards of dirt
14 there, because that was a low spot. As a matter of fact,
15 there's wetland back in there where they had cooling for
16 their water. And all that in back of Brooks Foundry is
17 filled in with foundry dirt. That must be 10, 12, 14 feet
18 deep. Is that going to suck some of that water or
19 contaminants, those wells out there? Like I say, it's got
20 me concerned. I'm really worried about it.

21 MR. LOPEZ: Bob Lopez again, Sheridan Township.
22 Correct me if I didn't hear you correctly. You have
23 project managers for each of these little contaminant
24 Superfund sites. Is there anyone in the EPA that has this
25 all mapped out around Albion and say, "My gosh, we've got a

1 big thing here"?

2 MR. BUINOWSKI: Enough is enough.

3 MR. LOPEZ: Enough is enough, in other words.

4 MR. LANOUE: Love Canal.

5 MR. LOPEZ: And then putting this into perspective
6 with regard to another industry that may be a thousand feet
7 from Amberton Village that is projected to be pumping
8 anywhere from 800,000 gallons of water -- a new pump, two
9 wells -- to a million gallons of water a day, and that not
10 being enough, also to tap into the City of Albion water,
11 and there is great concern that migration will occur,
12 because you also have, within that whole vicinity, maybe a
13 thousand-foot radius or whatever -- or less than a half a
14 mile, maybe -- you have the City of Albion water, the only
15 existing "good" water, apparently, in quotations. And
16 there's fear that it's on a shoestring right now
17 that -- you know, let's pray and hope. And I've heard one
18 comment from somebody that's not an expert that said,
19 "Maybe if you have the water sucking over here on the outer
20 areas, it will keep the migration from coming to that
21 particular well where the city gets their water from."
22 There's a lot of unknowns in this whole thing, and it's
23 scary. It's very scary. Now, question back -- who is
24 taking the responsibility for the whole area, because
25 they're so darned close together. Who's doing that on the

1 EPA that we could contact that would take everything
2 together and contact with all of these project managers so
3 there's constant networking so each one knows what they are
4 doing, because there's a totality here of a water problem.
5 That's my concern. I don't know who does -- do you have an
6 answer for that?

7 MS. EVISON: We are broken into geographic areas, and,
8 you know, the group I work with is working on sites in
9 Michigan. And, we do talk to each other. You know,
10 unfortunately, we do tend to concentrate on our particular
11 sites, but I think your issue is very important, that we
12 need to be aware of the larger context. There are some
13 areas where EPA has made a special effort to coordinate all
14 of the sites. We have -- we call them geographic
15 initiative areas. For example, the whole Detroit area of
16 southwestern (sic) Michigan is being handled in that way,
17 and the northwestern Indiana and adjacent Illinois area is
18 being handled that way. So far, this area is not being
19 handled that way.

20 MR. LOPEZ: And I'm concerned that it needs to be
21 handled that way, because we do have a critical mass of
22 pollutants and contaminants in this area, and that's why
23 it's important to at least look at the statistics and see
24 how we rank with other areas with regard to health issues.

25 MS. PENNOCK: I think this gentleman brought up the

1 cost and said that they may retrieve the costs from the
2 responsible parties, but what happens if the "may" isn't
3 there and they don't get it? Where do the Superfund monies
4 come from?

5 MS. EVISON: What's going to happen at this site is
6 that after we issue our decision about what the clean-up
7 process should be, we'll begin notifying the responsible
8 parties, the groups, the municipalities, the industries who
9 are responsible for the contamination of the landfill.
10 We'll begin negotiating with that group to come to an
11 agreement for them to bear the clean-up costs. If we don't
12 reach agreement, we may order the group to do the work, or
13 Superfund may decide to pay for it themselves. So those
14 are the three options.

15 MS. PENNOCK: Where does the Superfund money come
16 from?

17 MS. VALETKEVITCH: Superfund comes from when we
18 actually get parties to do the work and pay for the
19 clean-up, and sometimes we go back and do something called
20 a cost recovery, which is three times the amount of -- it
21 can be up to three times the amount. It gets back to the
22 fund -- extra money gets back to the fund, but I believe
23 it's largely made up of a tax on chemical and oil companies
24 and a small percentage of taxpayer dollars. So that's what
25 Superfund is made up of. Can we have your name, ma'am?

1 MS. PENNOCK: Paula Pennock.

2 MR. DINENNY: My name is Robert Dinenny, and I'm a
3 chemistry professor at Albion College. And as I read what
4 was in the paper and what was picked up this evening, this
5 meeting is to discuss the plan for what's going to happen
6 for remediation of the Sheridan-Albion Landfill. I really
7 resent certain people using this as a platform to submit
8 all kinds of what-if's with regard to what might happen
9 with the Albion Renewable Energy Project, and I think it's
10 entirely out of place. It would be nice to do everything
11 all at once. Unfortunately, it doesn't work that way.
12 What we are here for tonight is to discuss the plan that
13 EPA is proposing for remediation of the Sheridan-Albion
14 Landfill, and any discussion that does not bear on that
15 plan is not germane at this point.

16 MS. VALETKEVITCH: Do we have any more questions? Do
17 we have more questions?

18 MS. DIANICH: Helen Dianich. I'm a resident in
19 Sheridan Township since 1946. I don't have a degree in
20 chemistry. I am a concerned citizen. When this landfill
21 that you're talking about tonight was being used,
22 apparently there was no concern about health problems in
23 relation to the landfill. What is your EPA department
24 doing to prevent health problems from occurring in the
25 future; that is, heavy industry locating in the area, using

1 huge amounts of water and permits being refused by EPA?
2 I'm sorry, but I think this is a concern, and I think it
3 can be aired tonight. I'm sorry it is a concern. I wish
4 we didn't have it.

5 MS. EVISON: Many of the environmental issues are
6 handled these days by the state. EPA gets involved with
7 some permitting and with some clean-ups, like the
8 Albion-Sheridan Landfill. I guess I'm a little unclear on
9 the question, or would you like to make a comment for the
10 record?

11 MS. DIANICH: Well, my question is, when this landfill
12 was being used, I mean, there was no problem. How do we
13 prevent problems from happening? That's my question.

14 MS. EVISON: At landfills that are operating today?

15 MS. DIANICH: Not necessarily a landfill.

16 MS. EVISON: Although there are a lot of problems, I
17 do think there has been a lot of progress in environmental
18 regulation and in the state of the industry. And I think
19 it's important that communities stay very involved and
20 vigilant. I think the level of knowledge about these
21 things is much higher than it was in the past, and
22 hopefully we will see a better future.

23 MS. BARTZ: The technology is much more advanced as
24 well than in 1961 when this landfill opened.

25 MS. DIANICH: But like from 1994 to the next 20 years,

1 we're going to see another change, and that's what I'm
2 talking about.

3 MR. LOPEZ: Your well was contaminated, wasn't it?

4 MS. DIANICH: Oh, our wells were contaminated; sure.
5 We carried bottled water; just like going out and pumping
6 it and -- I mean, it was no big deal, you know, if you had
7 to carry water.

8 MR. MOORE: Ms. Chairwoman, could we get back on the
9 subject, please?

10 MS. VALETKEVITCH: Do we have any more questions?

11 MR. LANOUE: You mentioned the geographic Michigan
12 area, Detroit --

13 MS. VALETKEVITCH: There are three, actually, within
14 the region. We cover six midwestern states.

15 MR. LANOUE: As a group of concerned citizens who are
16 aware of more than one problem that exists -- very acutely
17 aware of this one and appreciate the good work that you've
18 done on this -- how would we go about seeking to create a
19 geographic initiative area here in Albion to address the
20 more acute needs that we have?

21 MS. VALETKEVITCH: Well, I think you started tonight.
22 You made a public comment. I will bring that public
23 comment to the geographic initiative coordinator who works
24 in my office. His name is John Perconne. And I will talk
25 with him about it, and maybe, if you'd like, I can have him

1 call you and talk about what he does and ways of forming
2 more geographic initiatives. They don't only look at
3 Superfund sites, but they look at air quality issues, and
4 they look at all environmental issues within that one
5 little area.

6 MR. LANOUE: Well, we've got, you know, air quality
7 issues here in town, too. I know the EPA is monitoring
8 Hayes-Albion, Harvard Industries and other sites, too. So
9 we have -- I mean, our city has some acute environmental
10 problems not unique to small towns with blue-collar
11 industry but, nonetheless, serious problems that maybe if
12 they were all being addressed, rather than piecemeal, you
13 know, simultaneously, maybe we could really make some real
14 progress.

15 MS. VALETKEVITCH: Sir, do you have a question?

16 MR. PRALUS: Yeah. We live right in front of the dump
17 right there, and the five acres they've got fenced in, why
18 do they keep holding that back where we can't do nothing
19 with it? It ain't no part of the dump.

20 MS. EVISON: This shows the approximate outline of the
21 waste, the area that has waste underneath it. And the way
22 we discovered that was by using geophysical instruments
23 across the surface that detect what's underneath. And the
24 fenced-in area -- Liz, can you show me where the fence is?

25 MS. BARTZ: I'm not sure if I'll draw it right. Is it

1 something like that?

2 MR. PRALUS: Well, it's right beside the house, right
3 by the road.

4 MS. EVISON: The fence goes all the way up to the road
5 and across even though the landfill itself is not right
6 here, because when we're working on the landfill, we need
7 an area, for example, to take contaminated water that we
8 moved off-site for treatment, needed a flat area to work
9 from. When the trucks were in here to dig the test pits,
10 they needed a staging area to enter through that could be
11 fenced off so that the public didn't come into contact with
12 any of the wastes.

13 MR. PRALUS: Okay. So they're going to use that
14 property. If they're going to use it, why don't they rent
15 it? We own it. You guys don't own it. Okay? You won't
16 let us use it. I cannot even set a trailer over there
17 because you guys have got your stuff over there. If you
18 can't find nowhere to, you know, put your stuff, why don't
19 you start paying rent for where your stuff's at. You don't
20 own it; we do.

21 MS. EVISON: I think what I'd like to do is get you in
22 contact with our attorney, Barbara Wester, and I can give
23 you her phone number after the meeting.

24 MR. PRALUS: Well, if you don't want to pay rent, why
25 don't you just buy it. Okay? That makes it even better,

1 because you don't own it. Your name's not on the deed.
2 You have not got rights to take up the land. It's not
3 yours; it's ours.

4 MS. EVISON: That's a very legitimate concern, and I
5 do think it should be taken up with us formally.

6 MR. PRALUS: It's not on the dump, they won't let me
7 set a trailer on it. Okay? I don't see why not, because
8 it's not in the drinking water. They check our drinking
9 water all the time, and it's not in it, so why can't we set
10 a trailer there? If they're going to use it, I think they
11 ought to pay rent. They even told us -- they fenced it in
12 and told us that we could not have a key to get inside
13 there, but they finally give us a key, because that's our
14 land, and they keep us off of it.

15 MS. EVISON: That's right. We've given keys to the
16 property owners that need access to their property on the
17 landfill, but we encourage them not to go inside the fence
18 because of the hazards that are in there.

19 MR. PRALUS: And they went in there, and they buckled
20 the septic tank that was on there. They're supposed to fix
21 it; ain't been fixed yet. So what's going on there?

22 MS. EVISON: I encourage you to -- could we get
23 together right after the meeting to get your phone number?

24 MR. PRALUS: They've got it.

25 MS. EVISON: I'd like to get you in touch with Barbara

1 Wester.

2 MR. BUINOWSKI: You've got to admit that we do have a
3 problem with this landfill. That's why we're going to
4 spend 600,000 or a million or a million and eight tenths or
5 whatever. Now, what my question is, being that I live --
6 I'm surrounded by this stuff -- and it is pertinent, sir,
7 regardless of what you say -- what are the responsible
8 people, the people that's supposed to be doing the job,
9 going to do to monitor any other project that comes in
10 there properly? And if you talk about technology, I'll
11 grant you, more sophistication; wonderful. But we killed
12 more Americans in Desert Storm with our sophisticated
13 lasers and our planes than we killed Iraqis. Saddam
14 Hussein is still alive and well. So you can talk all you
15 want about technology. We have mistakes and we have
16 disasters. We have people killed. What are we going to
17 do? Can anybody tell me? Are we going to do a better job,
18 or are we just going to let the next place come in there
19 and the same thing happen over again; the landfill, Brooks
20 Foundry, all these dumps? You have McGraw-Edison. That's
21 pertinent, sir. I live there.

22 AUDIENCE: You're living back in the 1950's, Vic.

23 MR. BUINOWSKI: You're damned right, and I'd rather
24 live back in the 1930's.

25 MS. VALETKEVITCH: I think we're going to have to

1 start public comments now, if you don't have any more
2 questions. Do you have a public comment?

3 MS. WHITTUM: Virginia Whittum. I would like to know,
4 when you pick this stuff up, where are you going to put it?

5 MS. EVISON: We're not proposing to remove most of the
6 waste in the landfill. We're only proposing to remove
7 about 200 drums. Is that what you're talking about?

8 MS. WHITTUM: I'm talking about -- well, you're going
9 to clean it up, aren't you?

10 MS. EVISON: Our proposal for the mass of the landfill
11 is to leave it where it is, protect it with a sophisticated
12 cap of -- a fancy plastic top with cover soils and sand and
13 gas collection so that the waste would stay there but not
14 leach contaminants into the groundwater.

15 MS. WHITTUM: Something about the environment and how
16 much problems we have with it; I think industry ought to
17 wake up. They're not being like they should be and caring,
18 and I don't think the people should have to put up with
19 this kind of thing, really; their water, have to buy water.
20 And it's really ridiculous. It's a ridiculous thing to
21 happen. Our grandfathers wouldn't have that. They had
22 more common sense than they do now.

23 MS. VALETKEVITCH: Another public comment?

24 MR. LANOUE: Yeah; Mike LaNoue. I was wondering; how
25 much did the EPA pay to have the preliminary studies done

1 by Earth Tech, the consultant?

2 MS. EVISON: The contract amount, I haven't put
3 together a list of the total cost to date. We allocated, I
4 believe, \$1.1 million for the process from the beginning
5 through the Record of Decision, which will be this winter.
6 I don't know that we're going to spend all of that, but
7 that is the ballpark range of what the investigation and
8 the feasibility study and the risk assessment cost. It's
9 very detailed work.

10 MS. PENNOCK: Are we supposed to just vote now if we
11 want to do this the way you are recommending or --

12 MS. VALETKEVITCH: Well, how it works is that we take
13 your public comments, we consider them as well as the eight
14 other criteria that are listed in the proposed plan fact
15 sheet, and after considering all comments and taking into
16 consideration past studies and such, the regional
17 administrator of the Environmental Protection Agency, at
18 EPA, will make a decision, based on all that information,
19 on which alternative to select.

20 MS. DIANICH: And what's his name?

21 MS. VALETKEVITCH: Valdas Adamkus, from Chicago.

22 MS. DERR: Now, you said there are regions. What
23 region are we?

24 MS. VALETKEVITCH: You're Region 5, and your base is
25 in Chicago. There are nine regions throughout the country

1 for EPA. Are there any other comments?

2 MR. LAMPART: Kenneth Lampart, Parma Township,
3 Amberton Village, and that's Jackson County. We're right
4 next to the dump site, or the back of the village is. I'm
5 concerned, and from what you say, the wells in Amberton
6 Village are okay, but is there anybody that worked at the
7 dump that recorded any illnesses in the past? And there's
8 probably a lot of people in the community that's used the
9 dump site. At one time, the dump was just a dust bowl, so
10 the dust went all over. If the site is as hazardous as you
11 say it is, in this blue paper, that should have been out
12 with the one that you mailed to us, it's a wonder that Erie
13 Road hasn't washed away. And the fenced-in area, I ain't
14 sure exactly how far that extends, but a neighbor told me
15 that it's open in the back or something or other, and kids
16 can get in there and play.

17 MS. EVISON: The fence extends all the way around the
18 landfill and has locked gates at either end. If anyone
19 sees the gate open, please call any of the phone numbers
20 listed in the fact sheet, and we'll get it locked up again
21 right away. Those gates should never be open.

22 MR. LAMPART: She was just saying that it was a hole
23 somebody could walk through or something.

24 MS. EVISON: We did find a couple of times during the
25 past year or two, holes cut in the fence which we repaired

1 as soon as we found them. And if you see that, we want to
2 know about it.

3 MR. LAMPART: And you could put larger signs up that
4 say "danger," and I wouldn't find it inadvisable to extend
5 the fence, theoretically. It should be beyond the dump
6 site, because they didn't just contain it in one area. I'm
7 sure when the dump was going on, they was pushing the
8 landfill all over the place.

9 MS. EVISON: I think through our studies we've been
10 able to pretty accurately outline the area that has waste
11 in it, and we did sample soils in the surrounding area and
12 found a few contaminants at very low levels. So,
13 basically, we did not find a problem with soils off-site.

14 MR. LAMPART: But you said your low levels were above
15 average.

16 MR. MOORE: That's not what she said.

17 MS. EVISON: I don't think so.

18 MR. LAMPART: For the federal drinking standards.

19 MS. EVISON: The groundwater beneath the landfill
20 exceeds the federal drinking water standards. The soil is
21 at a very low risk.

22 MS. VALETKEVITCH: Any other comments?

23 MR. LOPEZ: Reclamation of the land; what are the
24 plans for that once you do all this? It sounds like no one
25 can build on this or use it for any purpose until 15 years

1 or something. Is that what I'm hearing you say, or is
2 there a plan that as long as you have water piped into the
3 area close by, that that land can be used for certain types
4 of businesses? Is that a possibility?

5 MS. EVISON: Yeah, I think that is a possibility.
6 What's most important is that that groundwater that has
7 arsenic which exceeds drinking water standards is not used
8 for drinking. And that's one of the things we're going to
9 be looking at very closely in the next couple months is to
10 figure out how do we make sure that happens? How do we
11 make sure that people don't drink that water?

12 MS. VALETKEVITCH: So, most likely, it will be some
13 sort of future land use restriction.

14 MR. LOPEZ: That's what I mean.

15 MS. EVISON: But as far as using the surface of the
16 land away from the landfill, I don't know of any problems
17 with that.

18 MR. PRALUS: So what you're more or less saying is
19 that I could sit a trailer on that five acres as long as
20 I'm tapping into the house well?

21 MS. EVISON: I think the area that's inside the fence
22 now, we should talk afterwards, because it's a complicated
23 issue, and I'd like to talk one on one about that.

24 MS. VALETKEVITCH: Well, if there are no further
25 questions or comments, we will -- there is one?

1 MS. DERR: Who owns the land where the landfill is
2 except this young man?

3 MS. EVISON: The State of Michigan owns the rest of
4 the landfill land.

5 MR. LOPEZ: Do they own it because of back taxes?

6 MS. EVISON: Uh-huh (affirmative).

7 MR. LOPEZ: And if anyone had the nerve to buy it,
8 they could when it's cleaned up or what?

9 MS. EVISON: That's a legal issue.

10 MR. LOPEZ: That's a legal issue; okay.

11 MS. VALETKEVITCH: Okay. Well, we'll hang around and
12 answer any questions if you want to talk to us one on one.
13 Thank you all for coming.

14 (Off the record)

15 MR. LANOUE: I'm Mike LaNoue, Albion. I'd just like
16 to say that I think the EPA did an excellent job in terms
17 of focusing on the problems of the Sheridan-Albion
18 Landfill, and I appreciate the work that was done. My
19 concern is that we have a number of Superfund sites in the
20 area, and we'd like them all addressed simultaneously, if
21 they could be, to clear the community of these problems at
22 a more speedy rate. But I think the work that was done by
23 the EPA was very thorough and very professional, and I want
24 to thank the EPA for their work.

RECORDER'S CERTIFICATE AND NOTARIZATION

I, Susan J. Warner, Court Recorder, do hereby certify that
the foregoing is a true and accurate transcription of the
electronic recording made and recorded at the time and place of
the above hearing, and is all of the same so far as pertains
thereto.

Susan J. Warner

Susan J. Warner, CER-1386
Notary Public
My commission expires 03-16-96
